

BEAT THE HEAT

With UPM[®] Cold Applied
Permanent Pavement Repair Material

A patch of HMA can be effective IF:

Weakened, cracked, loose and damaged base material and asphalt surrounding the hole is **removed**

- AND -

Your crew doesn't have to **wait in line** all morning for mix because the plant has a big job

- AND -

It's not **raining**

- AND -

The hole is **cut and squared**

- AND -

The repair site is **primed with tack coat**

- AND -

The tack coat has broken for **proper bonding**

- AND -

The HMA is not already **cold and stiff** by the time it gets to the site

- AND -

The material is **compacted properly** to achieve performance based target density

- AND -

The repair is properly **edge sealed**

UPM is easy to use, requires less manpower, and takes just three steps to complete a repair; a patch made from HMA needs substantial labor and preparation steps to be effective.

Unlike HMA, **UPM can be installed in wet conditions;** any moisture will prevent good HMA adhesion.

US DOT: Do not place HMA on any wet surface or when surface temp is below 40°F. **UPM performs on wet and dry pavement, with seasonal grades for any temperature.**

HMA usability degrades rapidly as temperature of material drops- if not used fast enough, the material is worthless. From the moment the truck leaves the plant, the HMA begins cooling; **UPM is always ready for immediate use.**

UPM is a better alternative when an agency understands the time-value of money and seeks to make the most efficient use of valuable dollars and labor resources.

Summer Grade Formulation Now Available!*

* UPM Summer Grade is ideal for application when air temperatures range between 60° - 80° F. Otherwise, use UPM Spring/Fall grade for best performance. Contact your UNIQUE Account Executive to learn about the seasonal grades available in your area!

Permanent Solution | Cost Efficient | Meets Green Standards

Permanently Patching Potholes for Over 50 Years.
